ABSTRACT

Aloe vera L (A. barbadensis) is commonly used medicinal and cosmetic plant. In the present investigations the anti necrotic and anticlastogenic activity of Aloe vera extract was studied using Skin Papilloma, Melanoma Bone marrow micronucleus and chromosomal assays in Swiss albino and C57 Bl mice. It has been observed that topical application of Aloe vera extract on the skin tumour induced by DMBA (7.12 Dimethyl Benz (a) nthracene) and croton oil have significantly reduced the tumour size, weight and histological changes as compared to control group. Antinecrotic activity was also observed in skin melanoma tumour induced by subcutaneous administration of B6 F10 cell lines in C57 Bl mice. It reduced the tumour volume and increases the significant survival of animals as compared to control group. In anticlastogenic activity, Aloe vera extract have significantly prevented chromosomal aberrations and micronucleus formations in dose dependent manner. Results suggest the antinecrotic and anticlastogenic potential of Aloe vera extract in the above test systems.

Keywords: Anti Necrotic activity; Micronucleus assay; Chromosomal aberrations; Aloe vera; Melanoma; Papilloma

1 INTRODUCTION

In recent years, there have been considerable efforts to find naturally occurring substances that can inhibit, reverse, or retard mutagenesis. Wide arrays of substances present in the medicinal herbs or dietary plants have been screened for their ability to prevent mutagenicity [1]. Aloe vera L. (A. barbadensis) is used for several ailments. It belongs to the family Liliaceae. It is a popular household plant, found predominantly in dry localities in most parts of the world. A. vera is a rosette, long, slender, thick, fleshy leaves, like a smooth rubbery
cactus. The contents of a leaf can be separated into 2 basic components i.e. gel and latex. Aloe gel contains glucosmannan, acemannan, magnesium, glucose, linolenic acid, saponins, sterols, calcium, and cholesterol[5], while aloe latex (leaf lining) contains anthraquinone glycosides such as aloe emodin, and barbaloin[6]. A vera has high concentrations of vitamins A, C, and E[7], zinc[8] and amino acids, which are responsible for its usefulness in various pathological conditions. The acemannan of aloe has been used for topical treatment of wounds, minor burns, and skin irritation. Its Jel is commonly used on burns and minor cuts for enhancing the healing of dermal wounds[9]. Some recent studies have demonstrated the direct inhibitory effects of aloe extract and aloe gel on both tumor initiation and promotion. A polysaccharide fraction of aloe gel and aloe extract inhibited the binding of benzyopyrene to primary rat hepatocytes and thus prevented the formation of potential cancer-initiating benzyopyrene-DNA adducts[9]. In another study, aloe gel caused an induction of glutathione-S-transferase and inhibition of tumor promoting effects of phorbol myristic acetate[10]. These studies suggest a possible benefit of using aloe gel and aloe extract in cancer chemoprevention. Polysaccharides from aloe have shown radioprotective effects[9]. The alcoholic extract of Aloe vera has dose dependently inhibited gastric acid secretion[10]. Aloe emodin of Aloe vera have significantly inhibited MCC cells growth and possess specific toxicity to neuroectodermal cells[11]. Acemannan a carbohydrate from Aloe vera has shown anti immune and anti tumoral activities[12]. The extract exhibited the best for radical scavenging activity[13]. Antinecrotic and anticlastogenic activity gel and extract have not been well reported previously therefore in these studies preventive effects of Aloe vera extract has been studied using skin Papilloma model, micronucleus and chromosomal tests.

2 MATERIALS AND METHODS

2.1 Animals
Random bred Swiss mice of the weight between 15-20 gms were collected from animal colony of PBCRI, Satna. The synthetic pellet diet was obtained from Golden feeds Ltd, Delhi and R.O. water were provided ad libitum. The Animal ethical approval was obtained before conduction of the experiments. The chemicals were procured from Sigma chemical co. USA and Ranbaxy co., Mumbai. The Aloe vera extract was prepared from the gel collected from leaves as described in our earlier paper (Agrawal et al, 2013).

2.2 Antinecrotic effect of Aloe vera using Papilloma models
These animals received single application of DMBA (100 Dg in 100 DI acetone) (100 DI / mouse) and 1 % croton oil in Acetone two weeks after the application of DMBA. The all tumour bearing animals were divided in four groups.
(a) Aloe vera treated group: The 4 tumour bearing animals were given topical application of 100DI of Aloe vera extract (dose of 500 mg/kg body wt.), 2 times in a week for 16 weeks;
(b) The 4 tumour bearing animals were kept as a control till 16 weeks. The animals of both groups were euthanized after 16 weeks and tumour size as well as weight were measured and tumour tissue were fixed in 10 % formalin for histology.

2.3 C57BL Melanoma Model
I Group (Control): These animals received no treatment;
II Group (Cyclo+ Aloe vera extract): These animals received twice a week applications of Aloe vera extract (500 mg/kg) for one month + two applications of CP (300mg/kg) for two weeks;
III Group (Aloe Vera extract Alone): These animals received twice a week applications of Aloe vera extract (500 mg/kg) for one month;
IV Group (Cyclophosphamid Alone): These animals received two applications of CP (300mg/kg) for two weeks.

2.4 Experimental Design
The original cell lines (B16F10) were received from National Centre for Cell Science, Pune. These were maintained in our laboratory by serial transplantation of tumour cells by injecting 5 lakh cells subcutaneously to each mice for the induction of melanoma tumor. This method was performed as per the method reported by Oommen et. al. 1999 and standardized by us (Agrawal et al. 2009). The animals (C57BL mice) were divided into two groups comprises of 4 animals. When the tumor is grown up to 2-3 cm. large, the animals were divided into different. Groups such as control and tested group and each group comprised of 4 animals. The treatment of Aloe vera extract was given orally at the dose of 500 mg/kg. The survival rate was recorded. The data are represented in percentage survival of the animal, reduction in tumor volume, the life span of animals and total survival of animals. % ILS = (MST of control group-MST of experimental group/MST of control group) * 100.
control group) -1 ×100 whereas. The inhibition rate of tumor. It was calculated by following formula: %
IR = 1 - (Tumor volume of test group/Tumor volume of control group) × 100. Statistical analysis was done
using Students 't' test.

2.5 Anticlastogenic studies

The Antimutagenicity of Aloe vera extract was studied by chromosomal aberrations and micronuclei
induction in the bone marrow cells of mice. For chromosomal aberrations assay method of Preston et al.[14]
and the method of Schmid[15] for micronucleus assay and standardized by us was undertaken[16, 17]. Aloe vera extract at the volume of 0.2 ml was injected at different dose levels such as
250,500 and 750 mg/kg body weight 24 hours before the treatment of cyclophosphamide at the dose of
50 mg/kg body weight in 0.9 % saline. Colchicines (4 mg/kg b.wt) was administered intraperitoneally
2 hours before the harvest of the cells. The slides were prepared essentially as per modified method
Both femur bone of mice were dissected out and the bone marrow was flushed out in HBBS solution as
described earlier[16, 17]. The smear was prepared in precleansed slides, air dried and fixed in absolute
methanol. The slides were stained with Maygrunwald and Giemsa stain. The total no. of 2000 cells
were counted and number of micronucleated polychromatic erythrocytes cells were scored.
PCE: NCE ratio was also calculated. The data are presented in MNPCE ± SE. The statistical
significance was calculated using Student's 't' test.

3 RESULTS

The result showed the significant reduction of tumour size and weight as compared to control animals. The
 glutathione level in blood and liver showed significant increase as compared to control mice. The histology
 also showed reduced lessons and no advance changes leading to malignancy were observed in
Aloe vera treated mice (Table 1).

The findings of the present study on melanoma tumor model showed that the mice which received
the treatment of Aqueous extract of Aloe vera at the
dose of 750 mg/kg showed decreased Tumor volume
of 2073.7 ± 8.8 mm as compared to untreated
group i.e. 3424.9 mm. Whereas the survival of the above groups of animals were 20 days. When
Aloe vera extract (750mg/kg) in combination with
Cyclophosphamide (50mg/kg) was given orally to
mice than the Tumor Volume observed was 2380.1
± 5.28 and Mean Survival days was 19 days.
Cyclophosphamide alone showed the tumor volume of 2008.9 ± 17.0 but the mean survival days of
Melanoma bearing mice were 13 days only. It seems
that additive treatment of Aloe vera extract has
increased the survival of the animals as compared to
cyclophosphamide alone group. The histological
sections of Melanoma tumor showed that maximum
no. of viable cells and focal areas of necrosis were
observed in untreated group. The group receiving
Cyclophosphamide alone showed the presence of
equal quantity of viable and necrotic cells. In
combination, Cyclophosphamide with Aqueous
extract of Aloe vera showed the maximum area
covered by necrotic cells and few area of viable
cells. It seems the more necrosis in the tumor cells
represent the anticarcinogenic nature of Aloe vera
leaves extract (Table 2).
The dose of 500 and 750 mg/kg b.wt have significantly prevented the micronucleus formation and chromosomal aberrations whereas 250 mg/kg dose of aloe vera extract has prevented the micronucleus formation but it was not found statistically significant. The PCE/NCE ratio was not affected by Aloe vera extract treatment which shows no toxicity of the Aloe vera extract (Table 3 & 4).

4 DISCUSSION

The present study demonstrates the antinecrotic and antimutagenic potential of Aloe vera extract (AVE) in male Swiss albino and in the C57 Bl mice. Our previous study demonstrated that topical application of the AVE (500 mg/kg body weight) at the pre promotion phase showed a significant reduction in tumor incidence, tumor burden, tumor weight, tumor size, cumulative number of papillomas, in aloe-treated groups relative to the carcinogen treated control [18]. A polysaccharide fraction of aloe gel inhibited the binding of benzopyrene to primary rat hepatocytes and thus prevented the formation of potential cancer-initiating benzopyrene adducts [17]. A follow-up study published showed that several other plant-derived polysaccharides were also able to block benzopyrene DNA adducts [18]. The several report suggest the components of Aloe vera such as Aloe emodin has induced unscheduled DNA synthesis in primary hepatocytes from male Wistar rats, micronucleus formation in mouse lymphoma L5178Y cells and TK6 human lymphoblastoid cells, and chromosomal aberrations in Chinese hamster ovary cells. Aloeemodin also inhibited topoisomerase II, gave positive results in comet assays in mouse lymphoma L5178Y cells, SCC-4 human tongue cancer cells, and NPC-039 human nasopharyngeal carcinoma cells, and transformed C3H/M2 mouse cells whereas Aloe vera inner leaf fillet Qmatrix did not induce chromosomal aberration in Chinese hamster lung cells in vitro; micronuclei were not formed in bone-marrow cells of mice treated orally in vivo [20]. In the prevention of mutagenicity reactive oxygen species may have role in the above systems [17]. Anti inflammatory,antihepatitis, and prevent gastric ulcer were reported. Anthraquinones of Aloe vera latex have shown cytotoxic and antiangiogenic effects [19]. The present work suggests antinecrotic and anticlastogenic effect of Aloe vera extract in experimental mice.

ACKNOWLEDGEMENTS

The authors are thankful to Indian Council of Medical Research for providing financial assistance to carry out the above project work. The authors also thankful to Dr. S.K. Maheshwari Medical director of PBCRI,
Satna for providing facilities to carry out the above work.
